With economic pressures restricting campus budgets and healthcare policy issues capturing national attention, facilities managers at university-affiliated hospitals and other healthcare entities say they feel more urgency than ever to provide cost-effective services to patients, providers, medical researchers, and students.

Managing facilities at a university-related medical center is, in many ways, much like doing it on an academic campus—except in the many ways it isn’t, and that’s what makes their positions as facilities directors at major medical institutions particularly challenging. But it is also exciting, according to several APPA members who hold those positions.

“Life and death,” literally, is how they describe the principal difference between their management responsibilities at medical and non-medical facilities. “If a chiller fails at a medical or vivarium facility, it can be a life-and-death situation, while at a non-medical facility it could just mean folks are uncomfortable for a while,” says John C. Malmrose, chief facilities officer at the Medical University of South Carolina (MUSC).

Similarly, he says, while repairs of an after-hours elevator or power outage could probably wait until the next day at a non-medical facility, there is no waiting in a hospital. “We deal with the same issues as the rest of the university. The big difference is that there is a heightened sensitivity when everything doesn’t run perfectly,” Malmrose says.

THE LIFE-AND-DEATH FACTOR FOCUSING ON HEALTHCARE FACILITIES

By Alan Dessoff
“The hospital component is huge. You have patients on life support who rely on the facilities to be as close to perfect as possible. There are tensions and details necessary to make that happen. It’s a whole different mindset and level of intensity and accountability and risk,” says Gary Kittell, director of physical plant at the Upstate Medical University in New York.

“If the lights go off on an academic campus, everybody says, ‘Well, we’re going to get them back on as soon as we can.’ If they go off in a medical facility, it’s not tolerable. There is an extra burden to ensure that there are no glitches related to all the building systems essential for patient care,” adds William A. Daigneau, vice president for operations and facilities management at the University of Texas M.D. Anderson Cancer Center.

To keep systems operational, there are backups for everything at his facility, Daigneau says, including electricity, water and sewers, and “all sorts of testing requirements.” Emergency generators get monthly full-load tests. “We don’t just run them, we actually switch over and demonstrate that they can take their full load,” Daigneau explains. M.D. Anderson also has on-site water storage, and sewer systems have valving to prevent sewer backups. “You can’t have contaminants coming back into the facility,” Daigneau says.

Even when facilities have to be shut down for utility repairs, “you have to make accommodations for them, because unlike someone on a regular campus who maybe won’t get a hot meal or a warm shower that day, patients’ lives can be at risk,” says Kittell.

NO DOWNTIME ALLOWED

Compared to an academic campus, where students move in at the beginning of the school year and out at the end, “new patients move into our rooms every five or six days and the rooms need to be ready for them,” he continues. With the emergency department, operating rooms, and other units all operating around the clock, “you have to be absolutely on top of your game,” he declares.

In patient care, “there is no downtime allowed,” agrees Donald Rau, director of facilities management at the University of Kansas Medical Center (KUMC). “If a patient is in a room and there is no air conditioning in the summer or heat in the winter, it can get pretty bad. You have to respond right away and prevent as many things from happening to those patients as you can.”

ALWAYS ON YOUR TOES

At the same time, he adds, “If you’re around patients, you have to be courteous,” because how patients score their level of satisfaction with a facility is “extremely critical” in the intense competition among hospitals in an area.

Rigid oversight by accreditation agencies and government regulatory authorities helps ensure that their facilities are operating efficiently and effectively but also keeps them on their toes, these facilities professionals agree. They cite the Joint Commission on Accreditation of Healthcare Organizations (JCAHO), the key accrediting body for hospitals nationwide. “They are pretty unforgiving. They can come at any time, and you have to be on your game,” says Kittell of the Upstate Medical University.

“If you have a large facility like ours, they not only inspect the medical part of it but they bring along a ‘life safety’ specialist who goes through all your records, from generator testing to firewall locations to preventive maintenance. Then they spend a day or more touring the facility, looking above the ceilings, checking to make sure everything is as it should be. No areas are out of bounds,” Kittell says.
“The Joint Commission is taking a much more aggressive approach. It drives you to a state of constant preparedness for a visit, which I think is a good thing,” adds Skai Dancey, director of facilities operations at Oregon Health Sciences University (OHSU). Other accreditation bodies important to healthcare facilities, particularly those with research units, include the Association for Assessment and Accreditation of Laboratory Animal Care (AAALAC).

JCAHO and AAALAC “expect strict compliance with policies and procedures” and that can make a difference between accreditation and probation, says MUSC’s Malmrose.

SAFETY AND QUALITY
In addition to accreditors, “we have regulatory agencies that a regular campus wouldn’t have,” adds Mark Kenneday, vice chancellor for campus operations at the University of Arkansas for Medical Sciences (UAMS). He cites a recent visit by nuclear regulators who were “looking at how we take care of our isotopes. There’s always someone who has an interest in ensuring that we are being safe.”

“The patient care adds another level of regulatory oversight that can be challenging,” agrees Dancey, but can “drive us to a higher level of quality.” But in other ways, he adds, complying with the regulations can lead to increased costs, which can be a hard sell to other administrators who keep a close eye on budgets.

While facilities related to patient care get much of their attention, facilities officers also are responsible for other aspects of their

Gilsulate has insulated and protected underground pipes and tanks for over 60 years. This federally approved, patented system is economical, thermally efficient and hydrophobic. Gilsulate®500XR is load-bearing and provides a dry, stable environment for the long-term reliability of underground piping systems operating between 35° and 800° F. Examples of its many applications include steam, condensate, hot and chilled water.
we're trying hard to keep our preventive and efficient,” Malmrose says. That should make us more efficient. “That should make us more efficient.”

SIMILAR ISSUES FOR ANIMAL HEALTHCARE

Even healthcare facilities where four-legged creatures are patients and research subjects require intense management. “Our hospital runs 24/7, every day of the year, and we have to maintain the temperatures and keep the water running and the lights on,” says Christopher J. Phillips, director of facilities management at the University of Pennsylvania School of Veterinary Medicine. He also maintains facilities for animals used in research and “if I don’t protect those lives, the research stops,” Phillips says.

“I have a hard time making clear even inside the university that just because it’s a vet school, it’s still a healthcare facility. Sometimes the university doesn’t see that,” Phillips states. “If the university is shut down and students are sent home for some reason, like swine flu, I still have to keep this facility up and running. We’re not going to shut down. We’re dealing with lives, and if we don’t keep a building up and running, we are in jeopardy of losing a life. It’s an animal’s life, but it could be just as meaningful to somebody as losing a mother or father.”

Similarly, while accreditation of his facility is not at “the same high standard” of a hospital for humans, “if I don’t keep that accreditation, they’re liable to shut the door,” Phillips says.

INNOVATIONS DESPITE THE CHALLENGES

Facilities officers at healthcare facilities say they face many challenges. A key one is related to the economy. “Money is tight, and that translates into staffing reductions. But the demands of the campus haven’t changed. So the challenge is to meet facility needs with significantly reduced funding. How do we do it?” says Malmrose.

One way he is doing it, he says, is with technology “to help us manage our work,” including software that allows for mobile work order management and another software solution that eliminates duplicate databases. “That should make us more effective and efficient,” Malmrose says.

“We’re cutting out a lot of services, but we’re trying hard to keep our preventive and efficient,” Malmrose says. “That should make us more effective.”

The Oregon Health Sciences University, in Portland, occupies 5.3 million square feet, with 2 million for healthcare, including a 500-bed hospital, and the rest for academic and administrative uses. It spends $19 million annually on energy. The total staff of 11,000 includes a basic facility team of 110.

Skai Dancey, director of facilities operations since 2006, previously was a mechanical engineer and engineering manager. He earned a bachelor’s degree in mechanical engineering from Oregon State University and a master’s in business administration from Portland State University.
tion,” Daigneau adds. Facilities officers also cite APPA and the International Facility Management Association (IFMA) and report that local technical colleges often are good professional development providers.

LESSONS LEARNED

Given the responsibilities and accompanying stresses of their jobs, facilities officers at university-affiliated healthcare institutions say they have learned lessons about how to do their jobs well. “If you’re going to be effective at this,” says Kittell, “you have to think well beyond the facilities box, because there are a lot of sophisticated people in the various aspects of medicine, and they need to be advised about facility situations that impact their care of patients.” That means, Kittell explains, “being able to talk to them in terms they understand, and translate facility-speak to medical-speak and back-and-forth.”

The facilities officers say they also gain satisfactions that balance the demands of their positions. “Nobody really sees us unless there is something that isn’t getting done. But it’s very rewarding knowing that we are helping patients and doctors and researchers,” says Rau.

“I’ve worked both sides of the house,” says Daigneau, “and the thing I enjoy about healthcare is that it’s a focused mission. Higher education has a pretty diverse and sometimes diffused mission of what it is trying to accomplish, but in a healthcare environment, everybody works toward the same goal. It’s enjoyable to work in that environment.”
